

Neurodivergence is a term that **describes non-conventional ways of processing information from the world around us as a result of neurological development that differs from that of neurotypical individuals.**

With increased scientific research and decreased stigma, more adolescents and young adults are being identified as and/or identifying as neurodivergent (ND).

While neurodivergence is not a mental health condition, it is an umbrella term that describes people who have autism spectrum disorder (ASD), attention-deficit/hyperactivity disorder (ADHD), dyslexia, dyspraxia, Tourette syndrome, and other cognitive variations. While neurodivergence comes with unique challenges, it also brings valuable strengths like creativity, problem-solving, and deep focus.

What is 'neurodiversity'?
